Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization

The team identifies different ways to control access to records using a script-controlled ACL. The brainstorming focuses on restricting record access according to a field value, while considering security, accuracy, maintainability, and ease of implementation.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement: In a ServiceNow application, users should not be allowed to access certain records when a specified field contains a restricted value. A script-controlled ACL is required to check the field value and allow or deny record access accordingly.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Idea	Description
Idea 1 – Field Value Check	Use an ACL script to check the selected field value before granting access.
Idea 2 – Role-Based Check	Combine the field-value condition with the user's role to provide controlled access.
Idea 3 – Multiple Restricted Values	Block access when the field contains any value from a predefined restricted list.
Idea 4 – Allow Specific Values	Allow access only when the field matches an approved value.
Idea 5 – Reusable Script Logic	Keep the access-checking logic simple and reusable so that it can be maintained easily.

Step-3: Idea Prioritization

Idea	Priority	Reason
Field Value Check	High	Directly matches the project requirement and is simple to implement.
Allow Specific Values	High	Provides clear control over which records can be accessed.
Multiple Restricted Values	Medium	Useful when more than one field value must be restricted.
Role-Based Check	Medium	Adds an additional security

Selected Concept

Implement a script-controlled ACL that evaluates a specific record field value and grants or denies access based on the defined condition. This approach directly addresses the project objective of restricting record access based on field value.

Expected Outcome

Unauthorized access to records with restricted field values is prevented, while records that satisfy the access condition remain available to authorized users. The solution provides field-level decision logic within the ACL and can be extended with additional conditions when needed.
